qiq@kth.se

8 October 2014

### Motivation

### Industrial Standard in Big Data Era

Apache Hadoop Ecosystem

### Limits to growth in HDFS

Number of Files	Memory Requirement	Physical Storage	
1 million	0.6 GB	0.6 PB	
100 million	60 GB	60 PB	
1 billion	600 GB	600 PB	

### Hops-HDFS and Its Limitation

Distributed NameNode Architecture Maintain HDFS Strong Consistency Semantics Concurrency Restricted

### Problem Statement

#### **HDFS**

System-level Lock: Single Writer

### MySQL Cluster

Read Committed Isolation Level: Anomalies

### Hops-HDFS v1

System-level Lock: Single Writer + Network Latency

### Hops-HDFS v2 (Pessimistic Concurrency Control - PCC)

Row-level Lock: Implicit Locking -> Single Writer + Network Latency

### Contribution

### Architecture and Namespace Concurrency Control Accessment

GFS, HDFS, Hops-HDFS

### Performance Accessment and Limitation Analysis

HDFS v.s. Hops-HDFS v2 (PCC version)

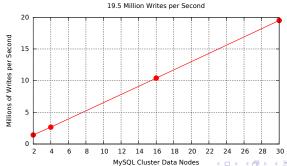

### Solution for Hops-HDFS

- Optimistic Concurrency Control with Snapshot Isolation on Semantic Related Group
- Performance Increase Up to 70 %
- Correctness ensured by Passing 300+ Apache HDFS Unit Tests: maintain HDFS semantics

## MySQL Cluster

### Distributed, In-memory, Replicated Database

- Scalable
- Fault-tolerance
- High throughput
- BUT: Supports only Read Committed Isolation Level

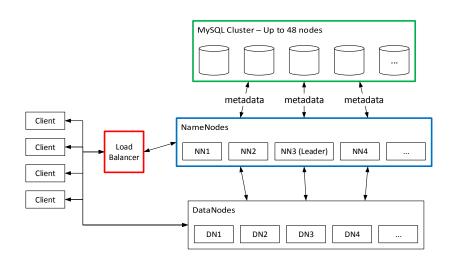

# Hops <sup>1</sup>-HDFS

### Overcome Limitations in HDFS NameNode

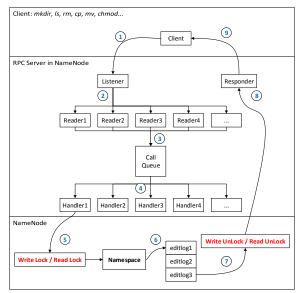

- Scalability of the Namespace
- Throughput Problem
- Failure Recovery

### Hops-HDFS Architecture

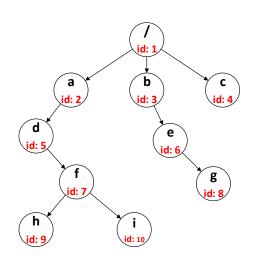

# HDFS Namespace Concurrency Control Assessment

### Hops-HDFS Namespace Structure

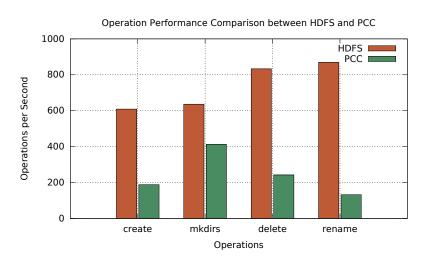

id	parent_id	name
1	0	/
2	1	а
3	1	b
4	1	С
5	2	d
6	3	е
7	5	f
8	6	g
9	7	h
10	7	i

# Limitations in Hops-HDFS Namespace Concurrency Control (PCC)

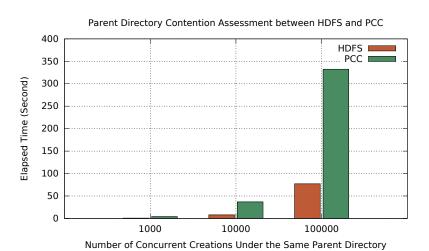

- Duplicated Round Trips
- Implicit Parent Locks:

id	parent_id	name	Locks by Tx1	Locks by Tx2
1	0	/	R	R
2	1	а	R	R
3	1	b		
4	1	С		
5	2	d	R	R
6	3	е		
7	5	f	W	W (Block)
8	6	g		
9	7	h (Tx1)	W (Implicit)	W (Implicit) (Block)
10	7	i (Tx2)	W (Implicit)	W (Implicit) (Block)

### NameNode Throughput Benchmark - HDFS v.s. PCC

### Parent Directory Contention Assessment - HDFS v.s. PCC

# Resolving the Semantic Related Group

### Path: $\sqrt{a/d/f/h}$

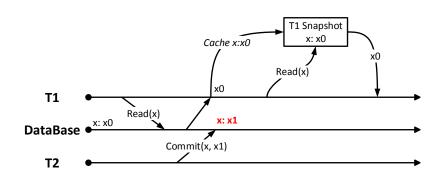

h: 
$${/->a->d->f}$$

	id	parent_id	name	other parameters
Related *	1	0	/	
Related *	2	1	а	
	3	1	b	
	4	1	С	
Related *	5	2	d	
	6	3	е	
Related *	7	5	f	
	8	6	g	
Selected ✓	9	7	h	
	10	7	i	

### Per-Transaction Snapshot Isolation

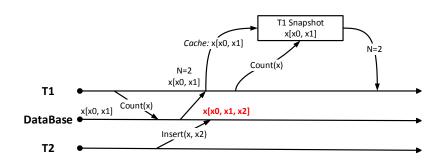

- Snapshot the whole Semantic Related Group
- Transaction performs on its own snapshot
- Preclude: Fuzzy Read & Phantom Read

# Snapshot Isolation Precludes Fuzzy Read <sup>2</sup>

<sup>&</sup>lt;sup>2</sup>Fuzzy Read: A transaction rereads data it has previously read and finds that another committed transaction has modified or deleted the data.

# Snapshot Isolation with Semantic Related Group Precludes Phantom Read <sup>3</sup>

<sup>&</sup>lt;sup>3</sup>Phantom Read: A transaction re-executes a query returning a set of rows that satisfies a search condition and finds that another committed transaction has inserted additional rows that satisfy the condition.

## Lock Mode in MySQL Cluster

**Read\_Committed** <sup>4</sup> Lock Mode: Consistent nonblocking reads (based on MVCC)

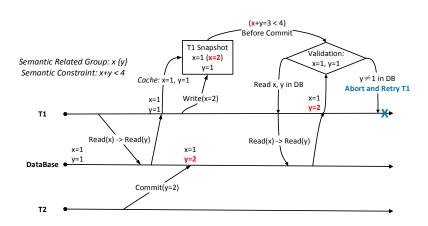

Lock Mode	Shared	Exclusive	Read_Committed
Shared	✓	Block	✓
Exclusive	Block	Block	✓
Read_Committed	✓	✓	✓

<sup>&</sup>lt;sup>4</sup>Read\_Committed here is the name of *lock mode* used in MySQL Cluster, not referring to *Isolation Level* 

# Optimistic Concurrency Control

- Read Phase: Read\_Committed lock on snapshot
- Validation Phase: Shared lock on related Rows, Exclusive lock on modified rows -> Compare versions with snapshot -> Abort & Retry or Update
- Preclude: Write Skew

# OCC with Snapshot Isolation on Semantic Related Group Precludes Write Skew <sup>5</sup>

<sup>&</sup>lt;sup>5</sup>Write Skew: Two concurrent transactions read the same data, but update different data that are related and the combination of updates leads to an inconsistency.

### Total Order Update, Abort & Retry, and Version Increase

- Total order update by ids ->preclude lock cycles
- Abort and retry transactions if "new" rows already exist
- Increase versions for successful update phase

## Four Phases in Algorithm

- Read Phase: resolve semantic related group & cache it as transactions snapshot copy
- Execution Phase: transactions operate on its own snapshot
- Validation Phase: validate snapshot versions with values in database ->abort & retry or go to update
- Update Phase: total order update, abort & retry and version increase

## Experimental Testbed

### MySQL Cluster

6 data nodes, 1 Gbps LAN, Intel Xeon X5660 CPU @ 2.80GHz, 6\*6=36 GB RAM, 2 data replicas

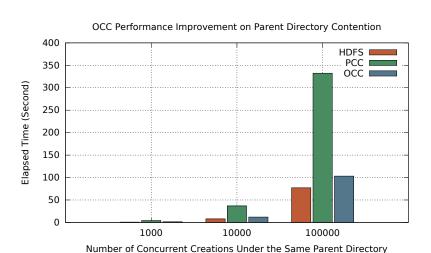

#### NameNode and Clients

Intel i7-4770T CPU @ 2.50GHz and 16 GB RAM

### MySQL Cluster and NameNode

100 Mbps LAN

# Parent Directory Contention Assessment (1/2)

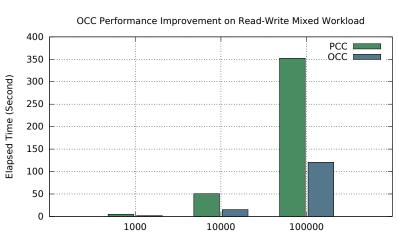

# Parent Directory Contention Assessment (2/2)

Num. of Concurrent Creation	1000	10000	100000
HDFS	0.82s	7.83s	77.13s
PCC	4.35s	36.74s	332.36s
OCC	1.36s	12.01s	103.23s
PCC / HDFS	530.5%	469.2%	430.9%
OCC / HDFS	165.9%	153.4%	133.8%
OCC Improvement: (PCC-OCC) / PCC	68.7%	67.3%	68.9%

## Read-Write Mixed Workload (1/2)

Total Number of Concurrent Operations Under the Same Parent Directory

# Read-Write Mixed Workload (2/2)

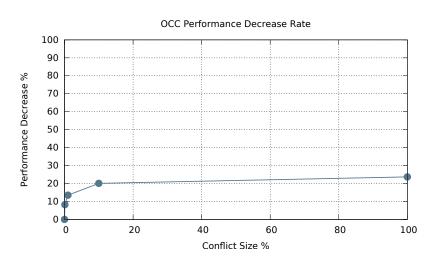

Concurrent Read+Creation	1000	10000	100000
PCC	4.92s	50.69s	352.25s
OCC	1.78s	15.31s	120.64s
OCC Improvement: (PCC-OCC) / PCC	63.8%	69.8%	65.8%

# OCC Performance with Different Size of Conflicts (1/2)

### Performance Decrease compares to 0% conflict size

Creations for	Conflict	Elapsed Time	Performance
10000 Operations	Size	(Second)	Decrease
1	100%	14.53	23.7%
10	10%	14.11	20.1%
100	1%	13.51	15.0%
1000	0.1%	12.72	8.23%
10000	0%	11.75	0%

# OCC Performance Decrease Rate (2/2)

## Implementation Correctness Assessment

Ensured by passing 300+ Apache HDFS Unit Tests

### Conclusion & Future Work

#### Conclusion

- Increase Performance up to 70 %
- Bounded Performance Degradation for OCC conflict
- Maintain HDFS Strong Consistency Semantics

#### Future Work

- OCC implementation on other operations
- OCC evaluation on Hops-HDFS with multiple NameNodes: prove that it outperforms HDFS with single NameNode

# Thank you!

### **Isolation Level**

Berenson, Hal, et al. "A Critique of ANSI SQL Isolation Levels." ACM SIGMOD Record 24.2 (1995): 1-10.

Isolation Level	Lost Up- date	Fuzzy Read	Phantom	Read Skew	Write Skew
Read Uncommitted	$\checkmark$	✓	✓	$\checkmark$	<b>√</b>
Read Committed	✓	✓	✓	✓	<b>√</b>
Cursor Stability	some-	some-	<b>√</b>	✓	some-
	times	times			times
Repeatable Read	Χ	Χ	<b>√</b>	Χ	X
Snapshot	Χ	Χ	sometimes	Χ	<b>√</b>
Serializable	Χ	Χ	Χ	Χ	X

# GFS Namespace Concurrency Control (1/3)

/d3	Read1	
/d1/ <mark>d8</mark>	Write1	Read2 (Conflicts: Write1)
/d3/ <mark>d8</mark>	Write1	
/d1/d8/Qi.txt		Write2

Table: Serialized Concurrent Mutations and Conflict Locks

### Workload of Parent Directory Contention Assessment

### Read-Write Mixed Workload

## The Size of Semantic Related Group

- 1. HDFS limits number of levels and length of full path name
- 2. 100 concurrent operations running under same parent directory:
